

The **textile industry** is the most receptive to Total™ so far.

Total™ can be integrated vertically or horizontally in the manufacturing process. It can be applied directly on the string or we can supply the maker of the finished product. Total™ can resist up to 100 washes, so it is very economic to use with a great reward in consumer loyalty.

A big part of the textile market is the non woven like filters, pillows, insulation material.

Also Total™ can become an important source of revenue as it can be sold in a liquid form, ready to use spray, to be applied on the garment as needed by the consumer.
